NADP(+) + H(2)O = L-lysine + 2-oxoglutarate + NADPH.

CATALYTIC ACTIVITY: N(6)-(L-1,3-dicarboxypropyl)-L-lysine + NAD(+) + H(2)O = L-glutamate + 2-aminoadipate 6-semialdehyde + NADH.

PATHWAY: Lysine degradation; Saccharopine pathway; first step.

PATHWAY: Lysine degradation; Saccharopine pathway; second step.

SUBUNIT: Homodimer (By similarity).

SUBCELLULAR LOCATION: Mitochondrial (By similarity).

TISSUE SPECIFICITY: Expressed in all 16 tissues examined with
                                                                                                                                                                                                                                                                                                                                                                                                S SWISS-PROT entry is copyright.                                                                                                                             The present sequence is a peptide which binds to thrombopoietin (TPO) receptor (TR). The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                            Thrombopoietin receptor-binding/activating peptide(s) and pepmimetic(s) - useful in treatment of haematological disorders,
                                                                                                                                                                                       Disclosure;

                                                                                                                                   The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). It has a molecular weight of < 8000 Da, and a binding affinity to TR as expressed by an ICSO of no more than about 100 mum. I compound (especially if modified, see features table) can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The paptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
